

ABCS Executive Overview

An executive introduction to the Autonomous Business Capability Specification.

Business semantics first

The Autonomous Business Capability Specification is focused on business meaning. It describes what the business can do and the canonical objects and contracts associated with that capability.

Capability is the universal primitive

A capability should remain meaningful even if the application, API, integration technology, workflow engine or agent changes. ABCS therefore separates business semantics from implementation mechanisms.

Relationship to Autonomy

ABCS is implementation-neutral. Sirvisetti Autonomy is a commercial governed execution platform that can implement capability concepts without making the specification dependent on the product.
